

SEED GERMINATION

VEGETATIVE GROWTH

Crop	First application	Second application	Third application	Fourth application	Fifth application	Yield target (reference)	Estimate N cost savings per acre
Canola	40 units UAN broadcasted pre-plant	7 gallons FW in-furrow @ planting	35 units UAN side-dressed @ early stem elongation	15 gallons FW foliar @ late stem elongation	10 gallons FW foliar @ flowering	50 bushel per acre	\$48.75

IMPROVE PLANT HEALTH – RESTORE SOIL QUALITY – INCREASE PROFITABILITY

FW= Firewater Product

UAN= Urea Ammonium-nitrate 28%

Urea= Urea 46%

Units= Actual pounds of nitrogen

DISCLAIMER: Chart above is an example to provide a base program for the use of Firewater as a partial synthetic nitrogen replacement. Please consult your agronomist prior to using Firewater in your program. Cost Savings are approximate and are based off of US commodity pricing during the time of writing this chart and may change rapidly. Yield Target is based off of common yield in traditional programs projected to be matched with Firewater.
